

Day 70

23/05/2025

MVVM - model  view  viewmodels

* we don't write code in xaml.cs

* unit test method → 

View - presentation layer

viewmodels - logic

References the view model to view

Mainwindow, ~~xaml~~ to link to viewmodel

↳  namespace

xmlns:VM = 'clr-namespace: ...;
assembly = ...';
→ create assembly

↳ Create key:

<Window.Resources>

<vm:RegisterViewModel x:key="regview"
></vm:RegisterViewModel>

<StackPanel datacontent=" {Binding Regview} ">

↓
Best approach

<Window.DataContext>

<Binding source="{StaticResource
regview}">

</Binding>

</Window.DataContext>

Model

after creating property

eg: `public String name {get; set;}`

↳ model

in view

<textbox Text="{Binding name}">
> </textbox>

to design

public class

viewmodel {

public string name {get; set;}

public viewmodel {

name = "hello";

↳ viewmodel

}

< StackPanel data content =
 { Binding Pathmode: name }
• if not used.

Text = " { Binding Pathmode: name }"

So we use data content
for common use

• < Window - data content >

this for whole
xaml file

< StackPanel datacontent >

for this specific layers.
